

C L A I M S

Sub 5
1
① A method of exposing a material to a neutron flux, wherein said material is distributed in a neutron-diffusing medium surrounding a neutron source, the diffusing medium being substantially transparent to neutrons and so arranged that neutron scattering within the diffusing medium substantially enhances the neutron flux, originating from the source, to which the material is exposed.

10
Sub 10
② A method according to Claim 1, wherein the distance, occupied by the diffusing medium, between the neutron source and the exposed material is at least one order of magnitude larger than the diffusion coefficient ~~(D)~~ for elastic neutron scattering within the diffusing medium.
15

20
③ A method according to Claim 1 ~~or 2~~, wherein at least the portion of the diffusing medium where the exposed material is distributed is made of heavy elements, so that multiple elastic neutron collisions result in a slowly decreasing energy of the neutrons originating from the source.

25
④ A method according to Claim 3, wherein said diffusing medium further comprises a neutron moderator surrounding the portion of the diffusing medium where the exposed material is distributed.

30
⑤ A method according to Claim 4, wherein a region of the diffusing medium, made of said heavy elements free of the exposed material, is located between the moderator and the portion of the diffusing medium where the exposed material is distributed.

Sub 10
⑥ A method according to Claim 4 ~~or 5~~, wherein the moderator is made of carbon or deuterated water.

⑦ A method according to ~~any one of Claims 3 to 6~~, wherein said heavy elements are lead and/or bismuth.

8. A method according to Claim 7, wherein the neutron source consists of a central region of the lead and/or bismuth medium, which is bombarded with a high-energy charged particle beam to produce neutrons by spallation.

5 9. A method according to Claim 8, wherein the lead and/or bismuth of said central region is in liquid phase, and is circulated by natural convection along a circuit (13-15) including a heat exchanger and an auxiliary heater.

10 10. A method according to ~~any one of Claims 1 to 7~~, wherein the neutron source consists of a beryllium or lithium target bombarded with a charged particle beam.

11. A method according to ~~any one of Claims 1 to 7~~, wherein the neutron source is a radioactive source.

15 12. A method according to ~~any one of Claims 1 to 7~~, wherein the neutron source consists of a spallation target bombarded with a high-energy charged particle beam.

20 13. A method according to ~~any one of Claims 1 to 7~~, wherein the neutron source is a critical fast breeder reactor core out of which fast neutrons leak.

25 14. A method according to ~~any one of Claims 1 to 7~~, wherein the neutron source is an energy amplifier core comprising a spallation target and a nuclear fuel material, wherein the spallation target is bombarded by a high-energy charged particle beam to produce high-energy neutrons which initiate a sub-critical process of breeding a fissile element from a fertile element of the fuel material and fission of the fissile element, whereby fast neutrons leak out of the energy amplifier core toward the diffusing medium.

30 15. A method according to Claim 14, wherein the nuclear fuel material comprises further fissile elements consisting of actinides to be disposed of.

35 16. A method according to Claim 14 or 15, wherein lead and/or bismuth form both said spallation target and

said neutron-diffusing medium, at least some of said lead and/or bismuth being in liquid phase and circulated along a cooling circuit to extract heat from the energy amplifier core.

5 17. A method of producing a useful isotope, which comprises transforming a first isotope by exposing a material containing said first isotope to a neutron flux, wherein said material is distributed in a neutron-diffusing medium surrounding a neutron source, the
10 diffusing medium being substantially transparent to neutrons and [so arranged that] neutron scattering within the diffusing medium substantially enhances the neutron flux, originating from the source, to which the material is exposed, the method further comprising the step of
15 recovering said useful isotope from the exposed material.

18. A method according to Claim 17, wherein at least the portion of the diffusing medium where the exposed material is distributed is made of heavy elements, so that multiple elastic neutron collisions result in a slowly
20 decreasing energy of the neutrons originating from the source.

19. A method according to Claim 18, wherein said diffusing medium further comprises a neutron moderator surrounding the portion of the diffusing medium where the
25 exposed material is distributed.

20. A method according to Claim 19, wherein a region of the diffusing medium, made of said heavy elements free of the exposed material, is located between the moderator and the portion of the diffusing medium where the exposed
30 material is distributed.

21. A method according to Claim 19 ~~or 20~~, wherein the moderator is made of carbon or deuterated water.

22. A method according to Claim 21, wherein the moderator is made of carbon, and has a thickness ~~(4r)~~ of
35 the order of 5 to 10 cm.

7. (23) A method according to ~~any one of Claims 18 to 22,~~
wherein said heavy elements are lead and/or bismuth.

5 (24) A method according to Claim 23, wherein the
neutron source consists of a central region of the lead
and/or bismuth medium, which is bombarded with a high-
energy charged particle beam to produce neutrons by
spallation.

10 (25) A method according to Claim 24, wherein the lead
and/or bismuth of said central region is in liquid phase,
and is circulated by natural convection along a circuit
(13-15) including a heat exchanger and an auxiliary
heater.

15 26. A method according to ~~any one of Claims 17 to 23,~~
wherein the neutron source consists of a beryllium or
lithium target bombarded with a charged particle beam.

27. A method according to ~~any one of Claims 17 to 23,~~
wherein the neutron source is a radioactive source.

20 X (28) A method according to ~~any one of Claims 17 to 23,~~
wherein the neutron source consists of a spallation target
bombarded with a high-energy charged particle beam.

25 29. A method according to ~~any one of Claims 17 to 23,~~
wherein the exposed material comprises ^{127}I as said first
isotope, which produces the useful radio-isotope ^{128}I by
capturing neutrons from the flux.

30 30. A method according to Claim 29, wherein the
exposed material is an iodine compound to be administered
to patients after the neutron exposure.

35 (31) A method according to ~~any one of Claims 17 to 28,~~
wherein the exposed material comprises ^{98}Mo as said first
isotope, which produces ^{99}Mo by capturing neutrons from
the flux, said ^{99}Mo being allowed to decay into the useful
radio-isotope $^{99\text{m}}\text{Tc}$.

(32) A method according to Claim 31, wherein the
exposed material comprises a phosphomolybdate complex salt
which, after the neutron exposure, is absorbed in an

alumina matrix from which the ^{99m}Tc is extracted after the decay of a substantial portion of the ^{99}Mo .

33. A method according to ~~any one of Claims 17 to 28~~, wherein the exposed material comprises ^{130}Te as said first isotope, which produces ^{131}Te by capturing neutrons from the flux, said ^{131}Te decaying into the useful radio-isotope ^{131}I .

34. A method according to Claim 33, wherein the exposed material comprises metallic tellurium, which is melted after the neutron exposure so as to volatilise the iodine content thereof.

35. A method according to ~~any one of Claims 17 to 28~~, wherein the exposed material comprises a fissile element as said first isotope, which produces fission fragments by capturing neutrons from the flux, said useful isotope being a radio-isotope extracted from said fission fragments.

36. A method according to ~~any one of Claims 17 to 28~~, wherein the exposed material comprises ^{124}Xe as said first isotope, which produces ^{125}Xe by capturing neutrons from the flux, said ^{125}Xe decaying into the useful radio-isotope ^{125}I .

37. A method according to ~~any one of Claims 17 to 28~~, wherein the exposed material comprises a semiconductor material, and the useful isotope is a doping impurity within said semiconductor material, which is obtained from neutron captures by a first isotope of the semiconductor material.

38. A method according to Claim 37, wherein the semiconductor material consists of silicon, with ^{30}Si as said first isotope producing ^{31}Si by capturing neutrons from the flux, said ^{31}Si decaying into ^{31}P as an electron-donor doping impurity.

39. A method according to Claim 37, wherein the semiconductor material consists of germanium, with ^{70}Ge as

said first isotope producing ^{71}Ge by capturing neutrons from the flux, said ^{71}Ge decaying into ^{71}Ga as an electron-acceptor doping impurity, and also with ^{74}Ge producing a smaller amount of ^{75}Ge by capturing neutrons from the flux, said ^{75}Ge decaying into ^{75}As as an electron-donor doping impurity.

40. A method of transmuting at least one long-lived isotope of a radioactive waste, by exposing a material containing said long-lived isotope to a neutron flux, wherein said material is distributed in a neutron-diffusing medium surrounding a neutron source, the diffusing medium being substantially transparent to neutrons and so arranged that neutron scattering within the diffusing medium substantially enhances the neutron flux, originating from the source, to which the material is exposed, and wherein at least the portion of the diffusing medium where the exposed material is distributed is made of heavy elements, so that multiple elastic neutron collisions result in a slowly decreasing energy of the neutrons originating from the source.

X 41. A method according to Claim 40, wherein said heavy elements are lead and/or bismuth.

42. A method according to Claim 40 ~~or 41~~, wherein said transmuted isotope comprises ^{99}Tc . $\beta^- \rightarrow \text{Ru } 100$

43. A method according to ~~any one of Claims 40 to 42~~, wherein said transmuted isotope comprises ^{129}I . $\beta^- \rightarrow \text{Xe } 130$

44. A method according to ~~any one of Claims 40 to 43~~, wherein said transmuted isotope comprises ^{79}Se . $n_c \rightarrow \text{Sc } 80$

45. A method according to ~~any one of Claims 40 to 44~~, wherein the neutron source is a critical fast breeder reactor core, out of which fast neutrons leak.

46. A method according to ~~any one of Claims 40 to 44~~, wherein the neutron source is an energy amplifier core comprising a spallation target and a nuclear fuel material, wherein the spallation target is bombarded by a

high-energy charged particle beam to produce high-energy neutrons which initiate a sub-critical process of breeding a fissile element from a fertile element of the fuel material and fission of the fissile element, whereby fast
5 neutrons leak out of the energy amplifier core toward the diffusing medium.

47. A method according to Claim 46, wherein lead and/or bismuth form both said spallation target and said neutron-diffusing medium, at least some of said lead
10 and/or bismuth being in liquid phase and circulated along a cooling circuit to extract heat from the energy amplifier core.

48. A method according to Claim 46 ~~or 47~~, wherein the nuclear fuel material comprises further fissile elements
15 consisting of actinides to be disposed of.
